

Georeferenced Managed Objects and InfraWorld

Jan Kolář, Ph. D.

Why?
The Idea
How? ...

InfraWorld Project Information

Partners:

Duration of the project:
2008-2012

Total budget: 36,7 MNOK (4.6 MEUR)

Funding contribution from NFR: 12 MNOK (1.5 MEUR)

Overview

Motivations

Background, Flexible Data Model, Goals, InfraWorld Scope.

Georeferenced Managed Objects

Objects and Managed Objects, Runtime, Storage and Communication, Accessing MOs.

GMOs in gvSIG & Results

Implementation in gvSIG, Video, GRIFIN Shell, Future work.

Conclusions

Motivation (R&D Background)

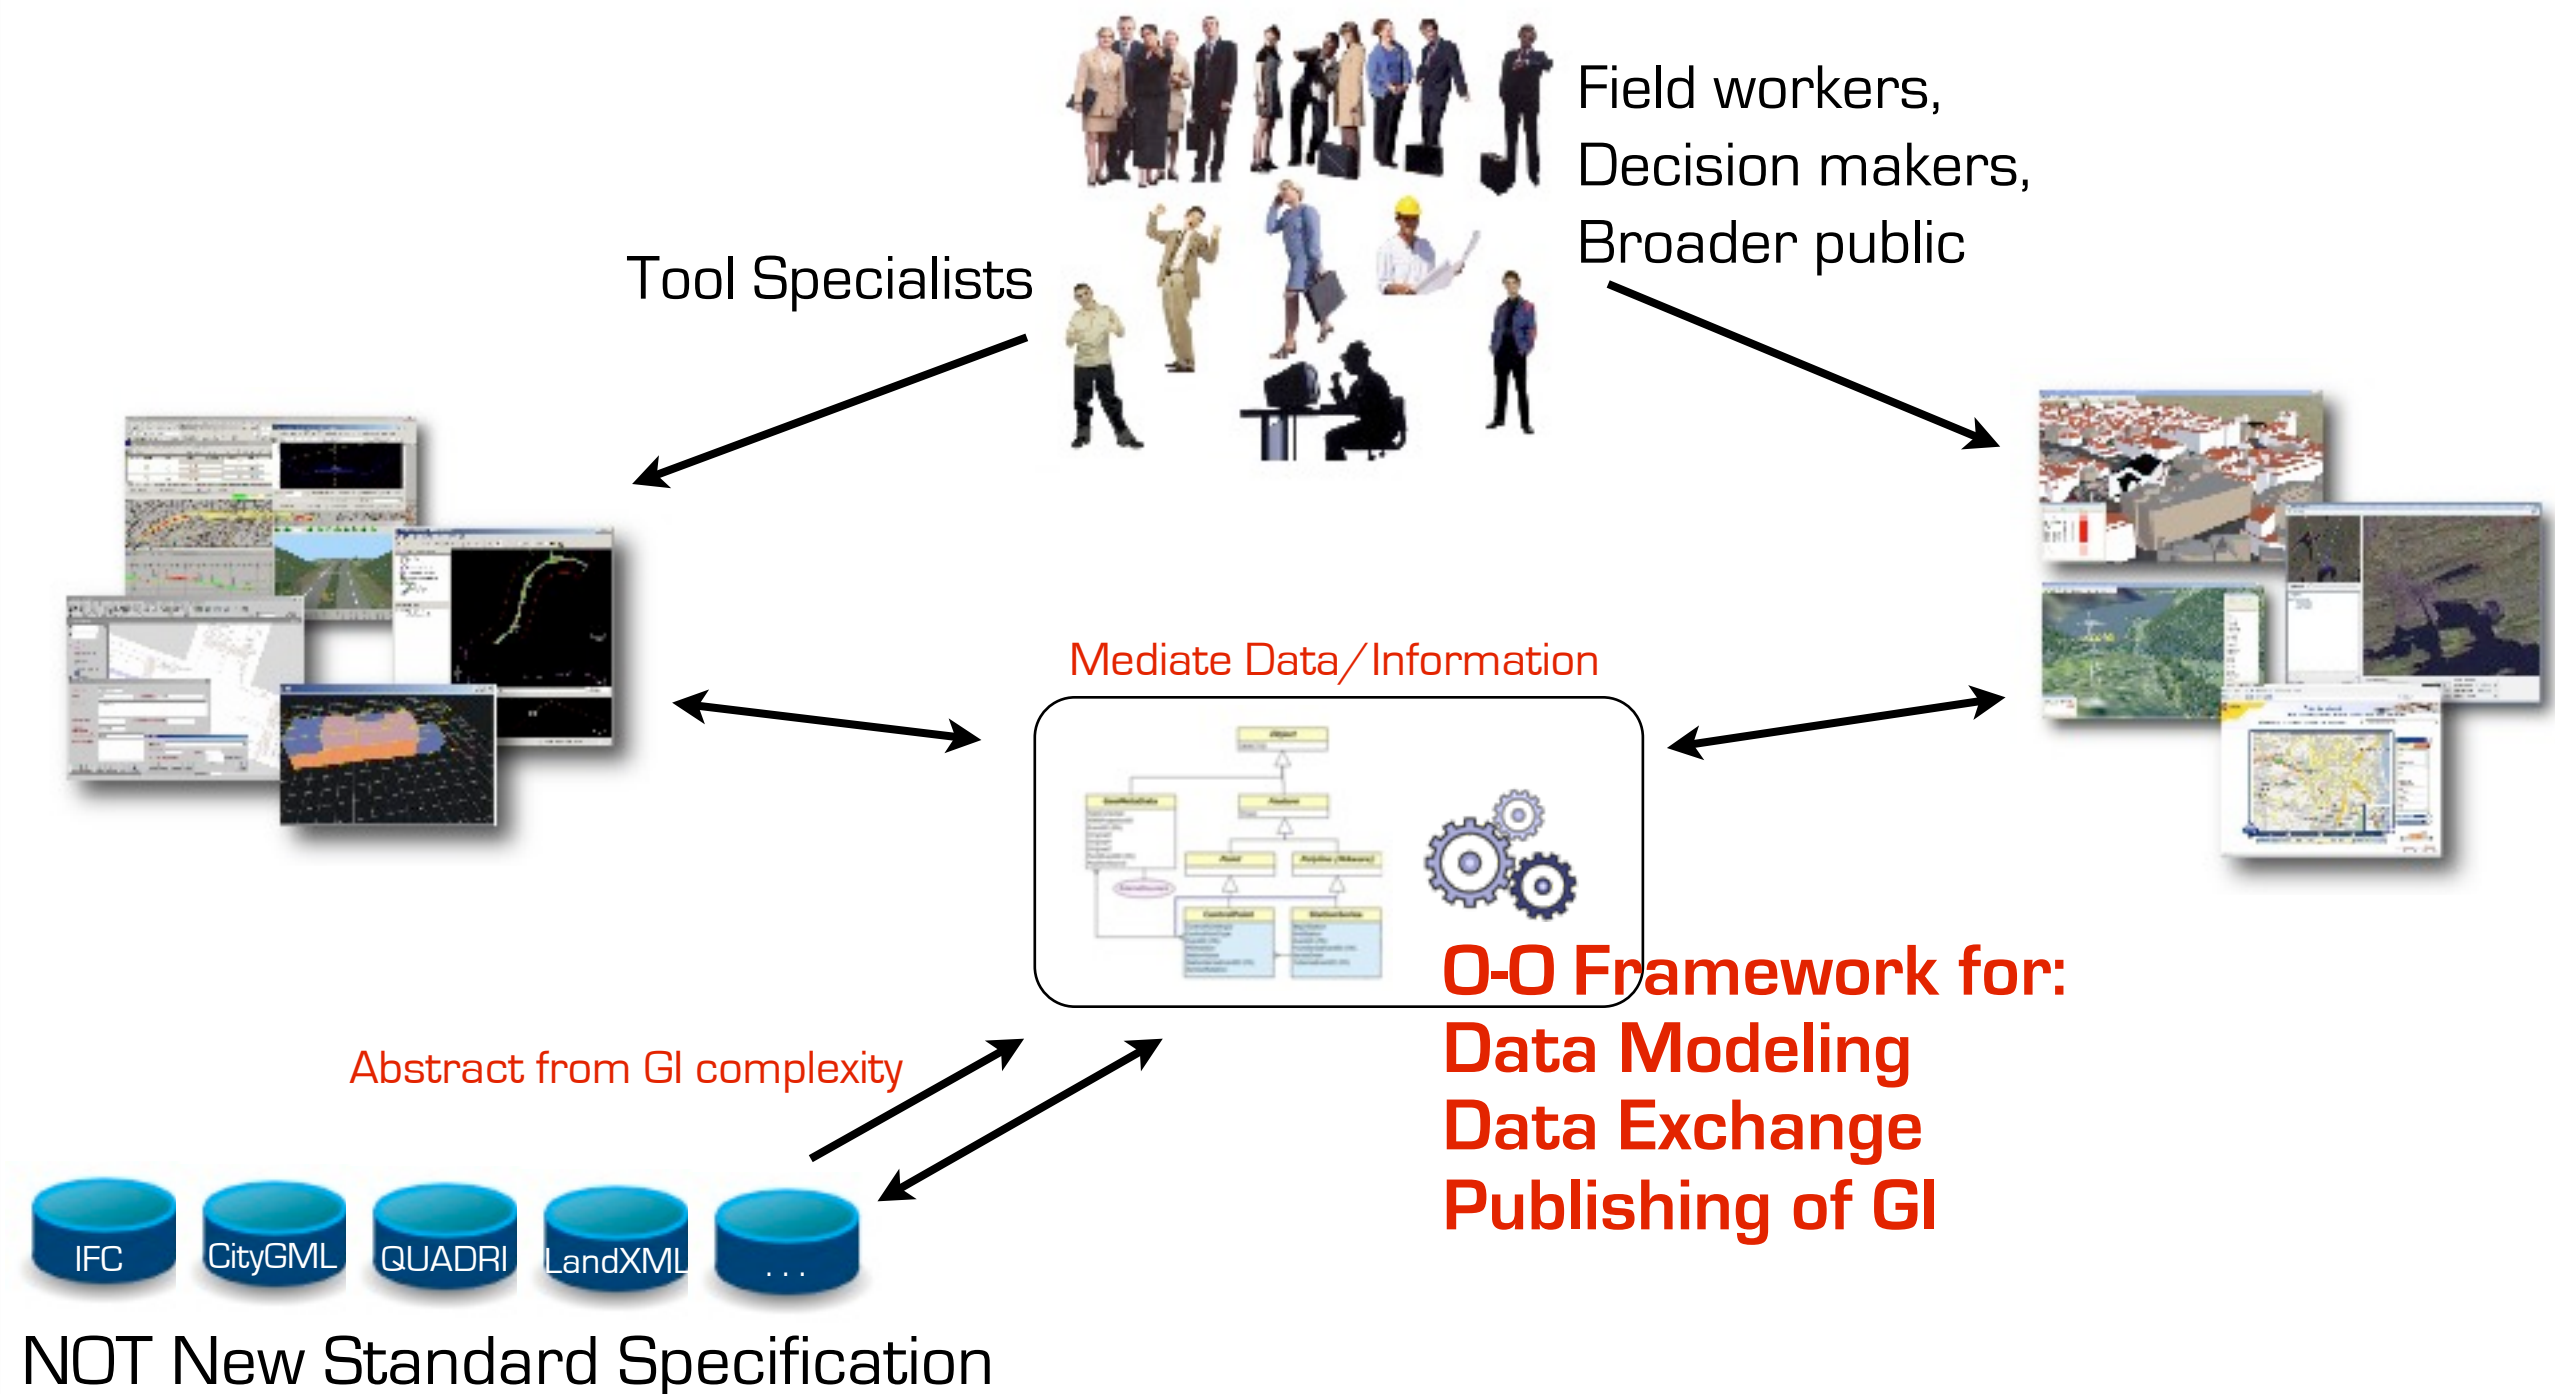

Centre for 3d GeoInformation
ended 2005

Mechanism for handling 3DGI
Distributed network arch.
3D + Time Data Model
Geospatial indexing for SDI
Visualization and navigation in 3D

Many, different types of geospatial information

Data model *shapes* Software implementation

R&D on Flexible Data Model for GI

Virtual Map

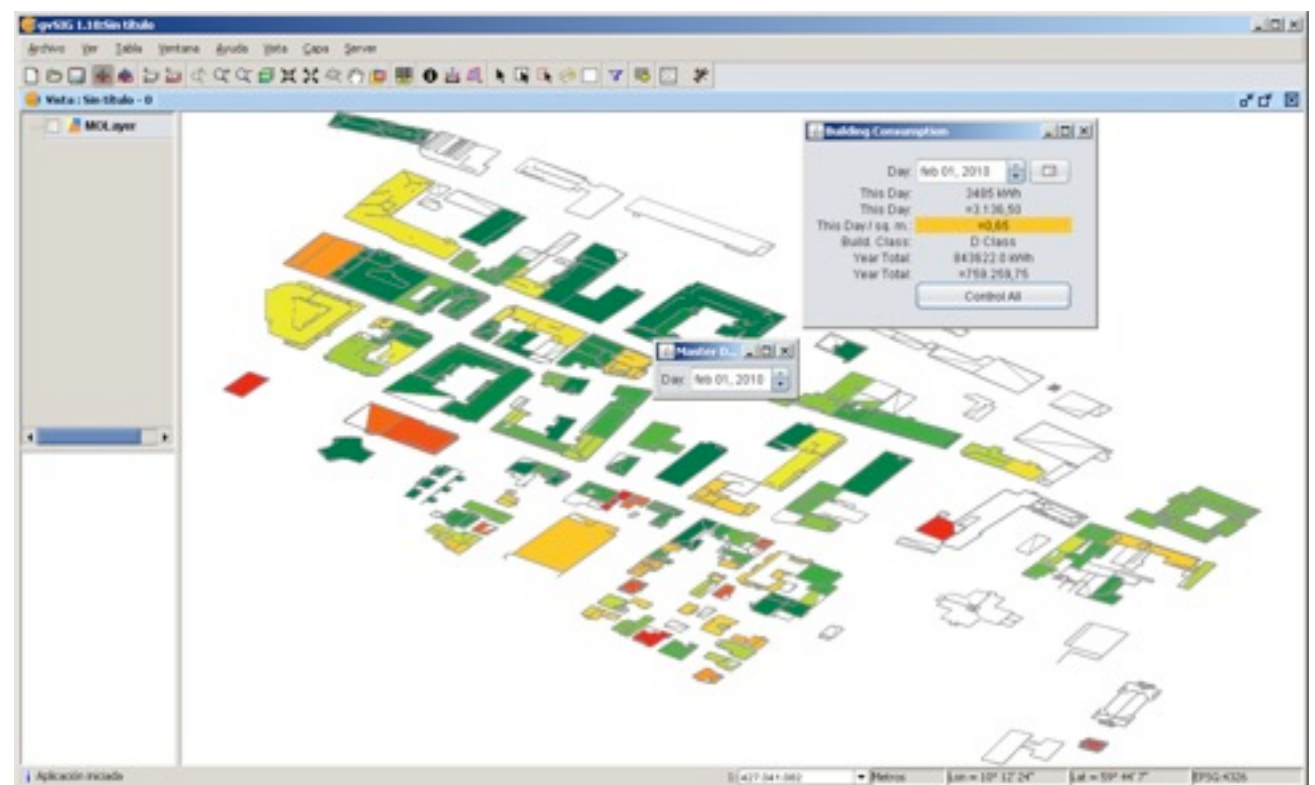

.NET & JVM

Virtual Globe

Java

gvSIG

GRIFIN

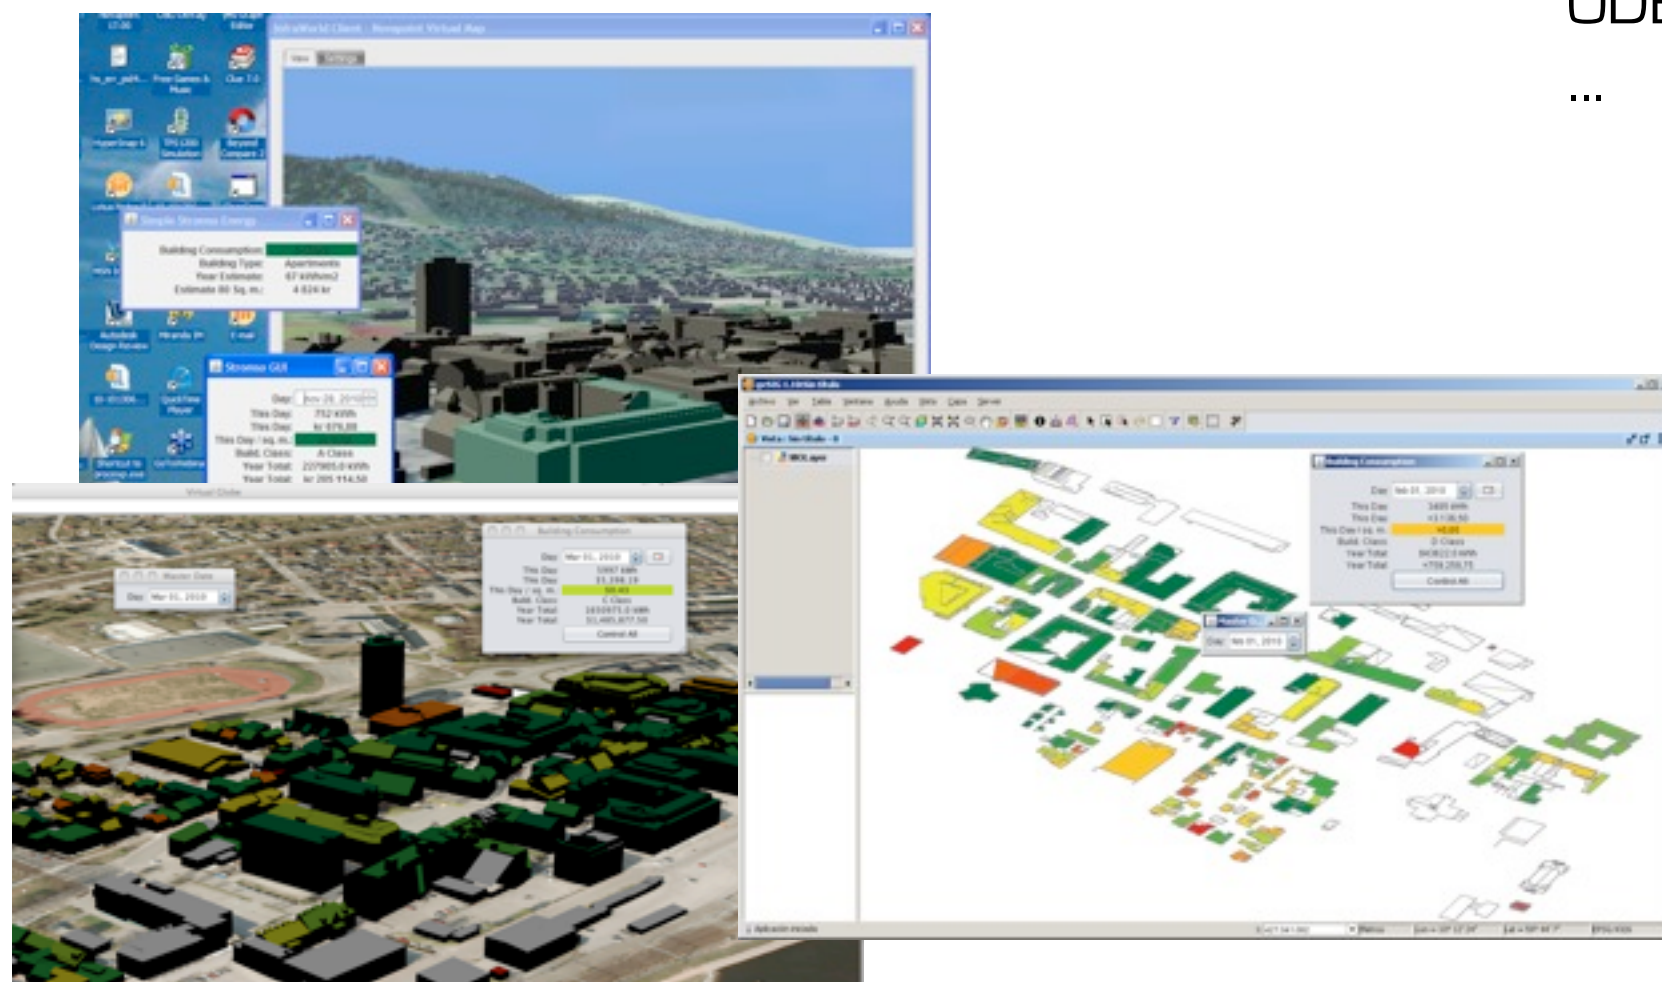

Managed Objects

InfraWorld Goals

InfraWorld
ends 2012

Viz independent of rendering tech.
Supporting clients on diff platforms
Tables and layers as GIS case
ODB with single geospatial index
...

Overview

Motivations

Background, Flexible Data Model, Goals, InfraWorld Scope.

Georeferenced Managed Objects

Objects and Managed Objects, Runtime, Storage and Communication, Accessing MOs.

GMOs in gvSIG & Results

Implementation in gvSIG, Video, GRIFIN Shell, Future work.

Conclusions

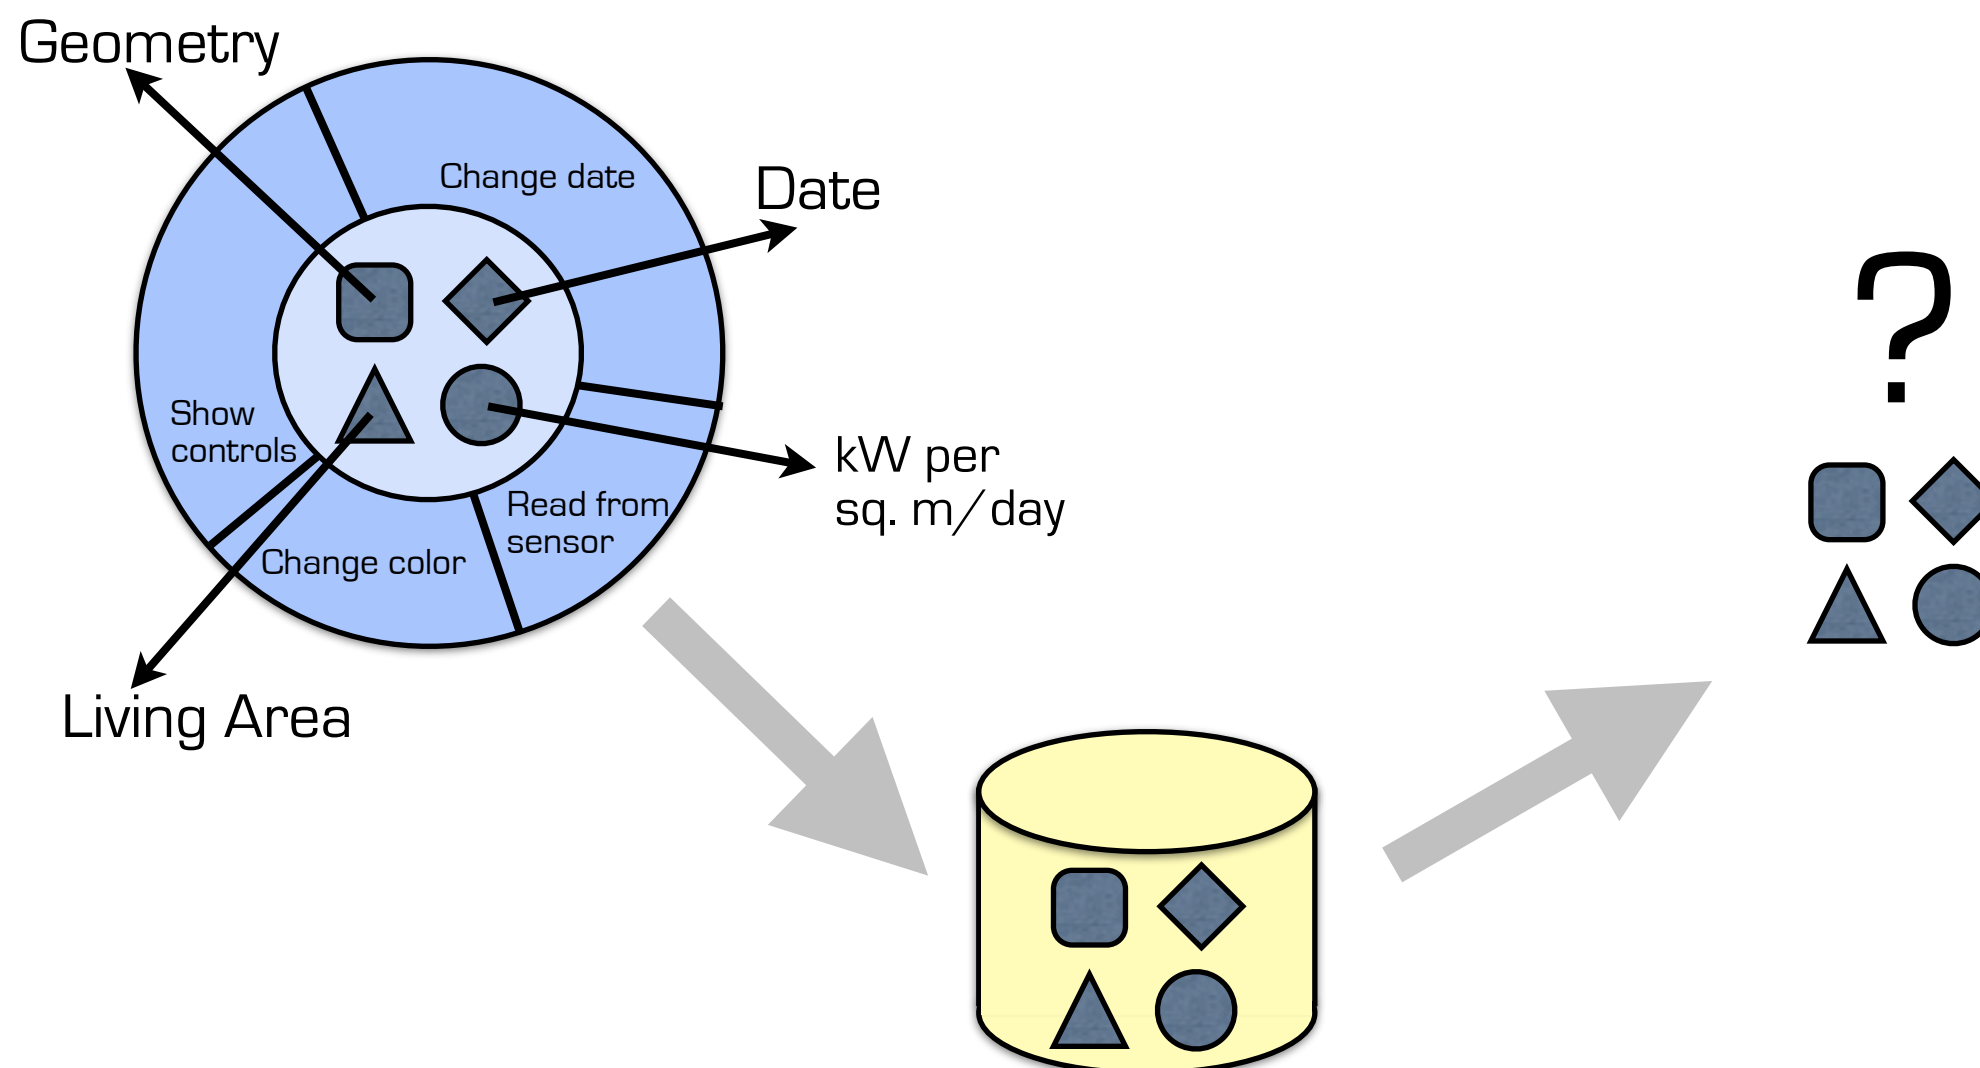

Object & Data Exchange

Only Data are stored, functionality in apps

Cannot be used by other system

Need for standard exchange format

Managed Object

MO solution needs Runtime

Standard Runtime:
rules how to build & run apps

Standard Format/Protocol:
rules what to code (fixed data model)

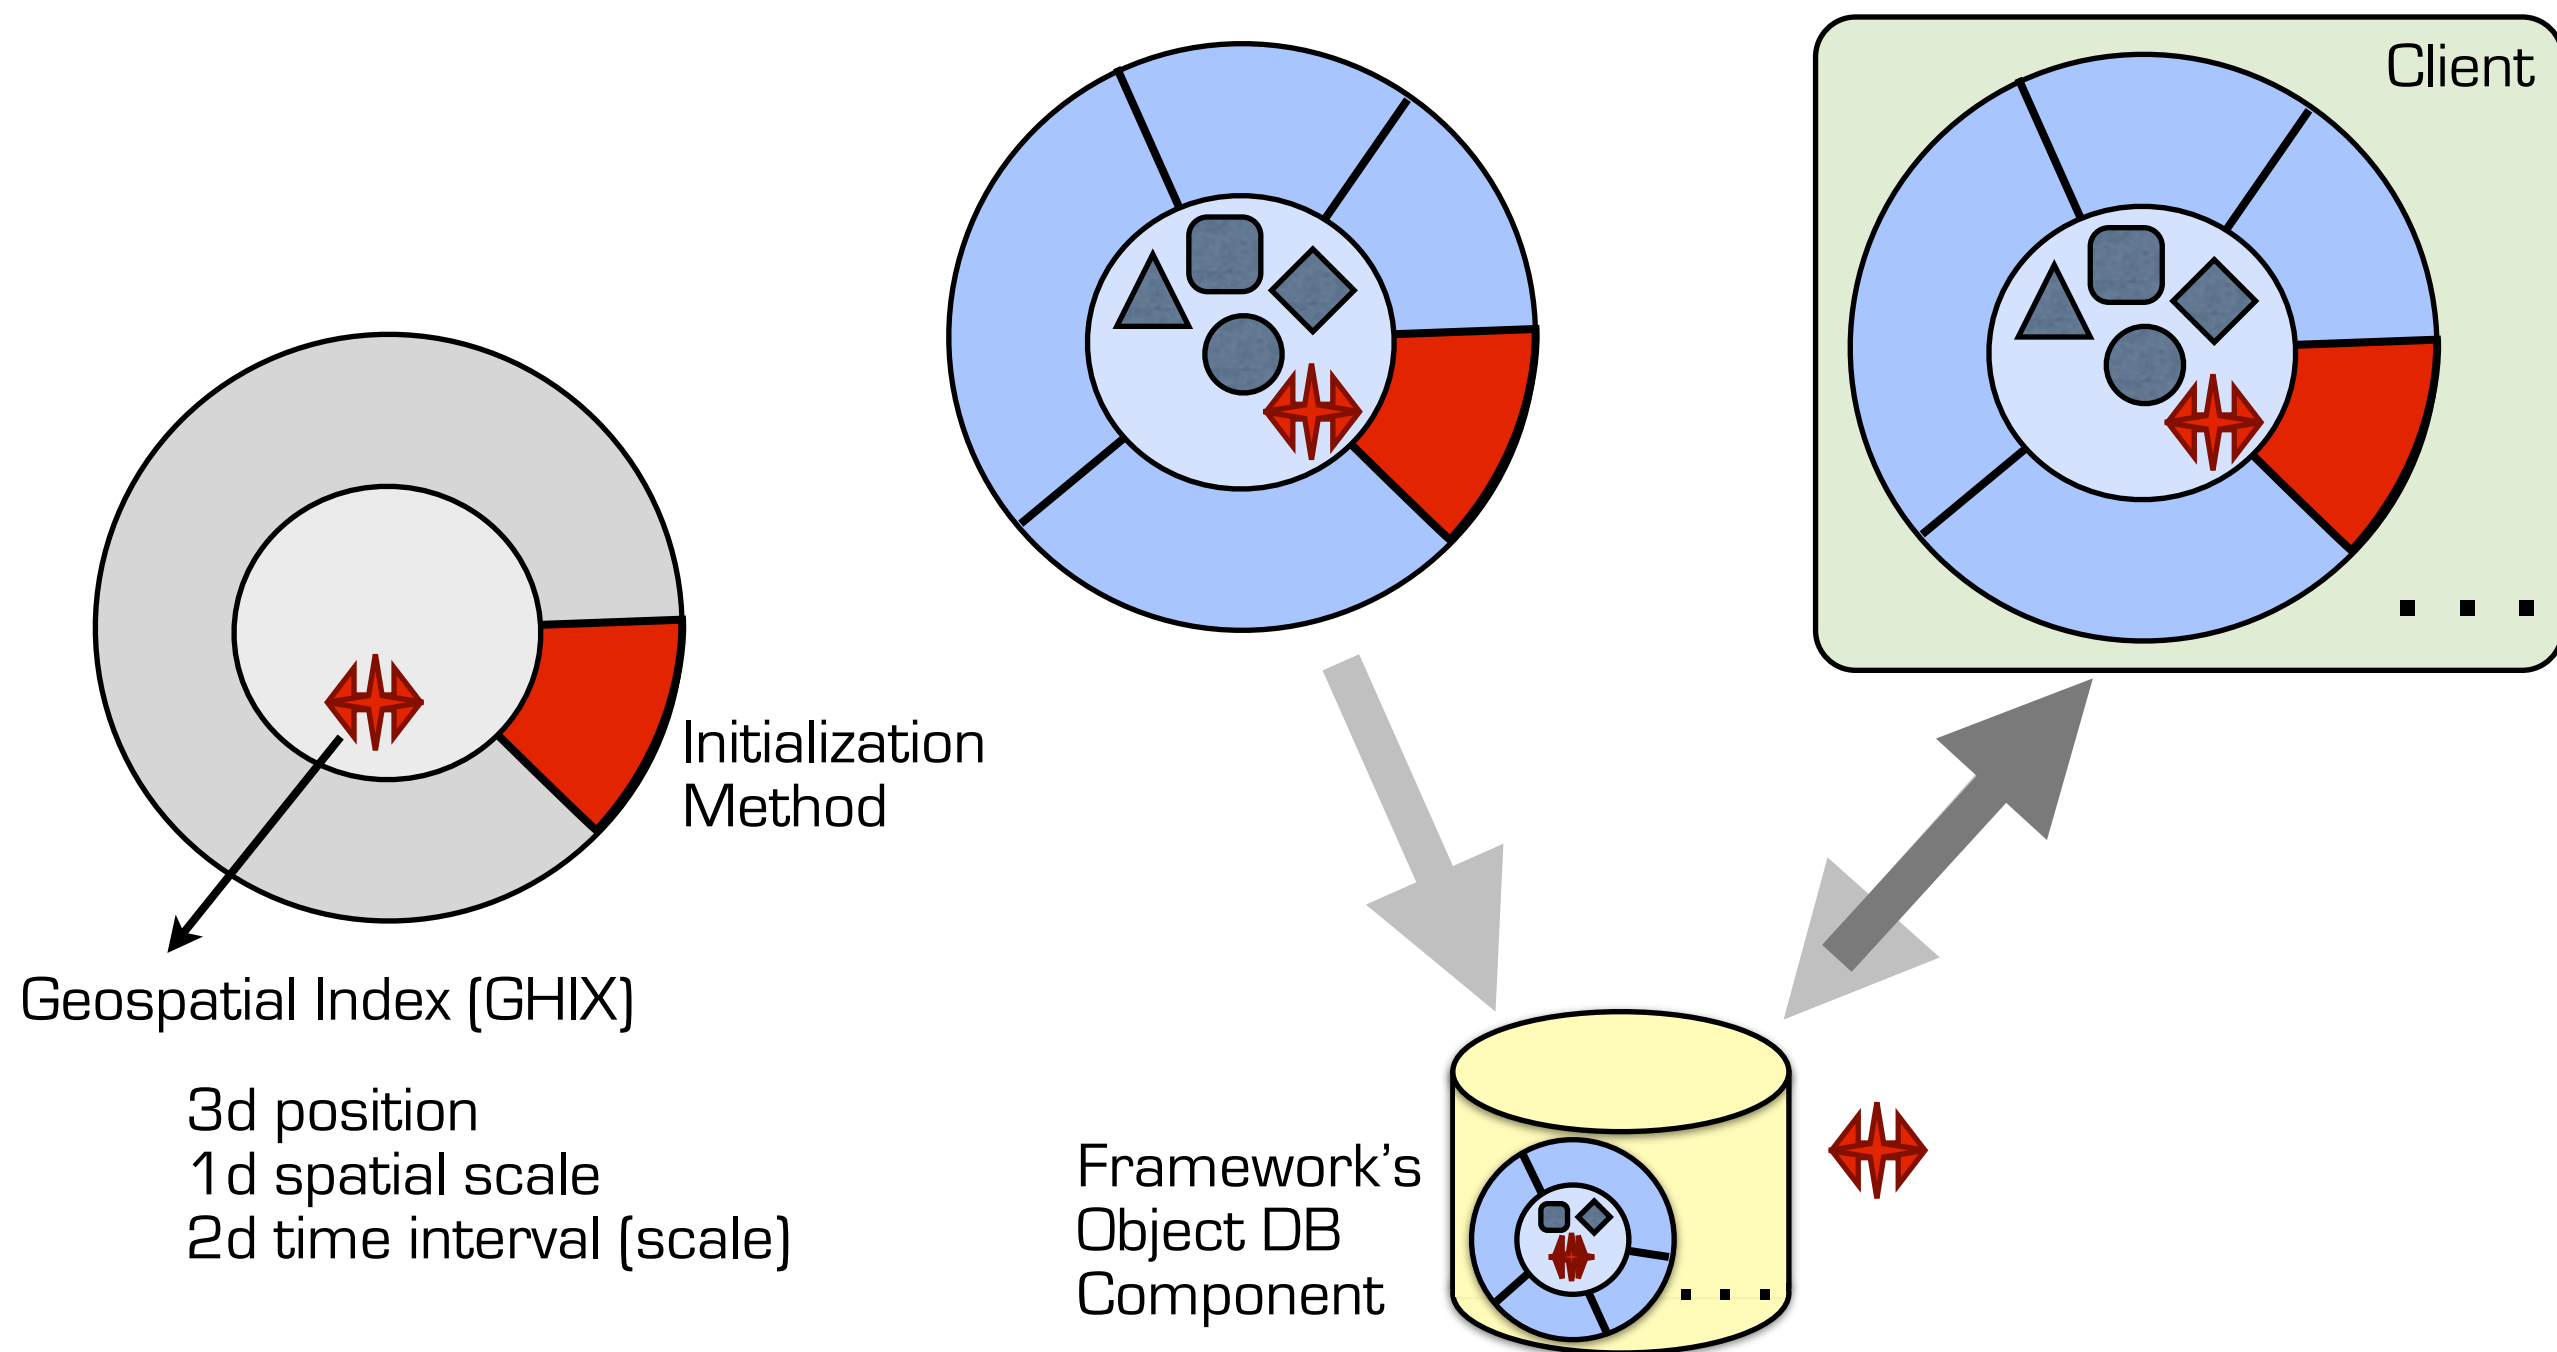

System Runtimes: .NET, Java RE (JRE)

One Runtime must be used by all!

Georeferenced MO

Overview

Motivations

Background, Flexible Data Model, Goals, InfraWorld Scope.

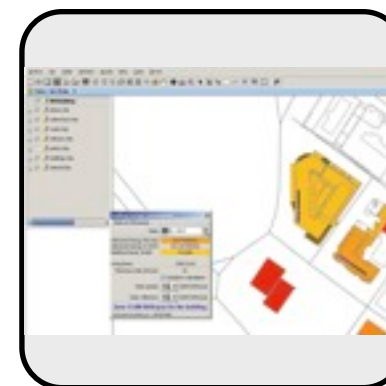

Georeferenced Managed Objects

Objects and Managed Objects, Runtime, Storage and Communication, Accessing MOs.

GMOs in gvSIG & Results

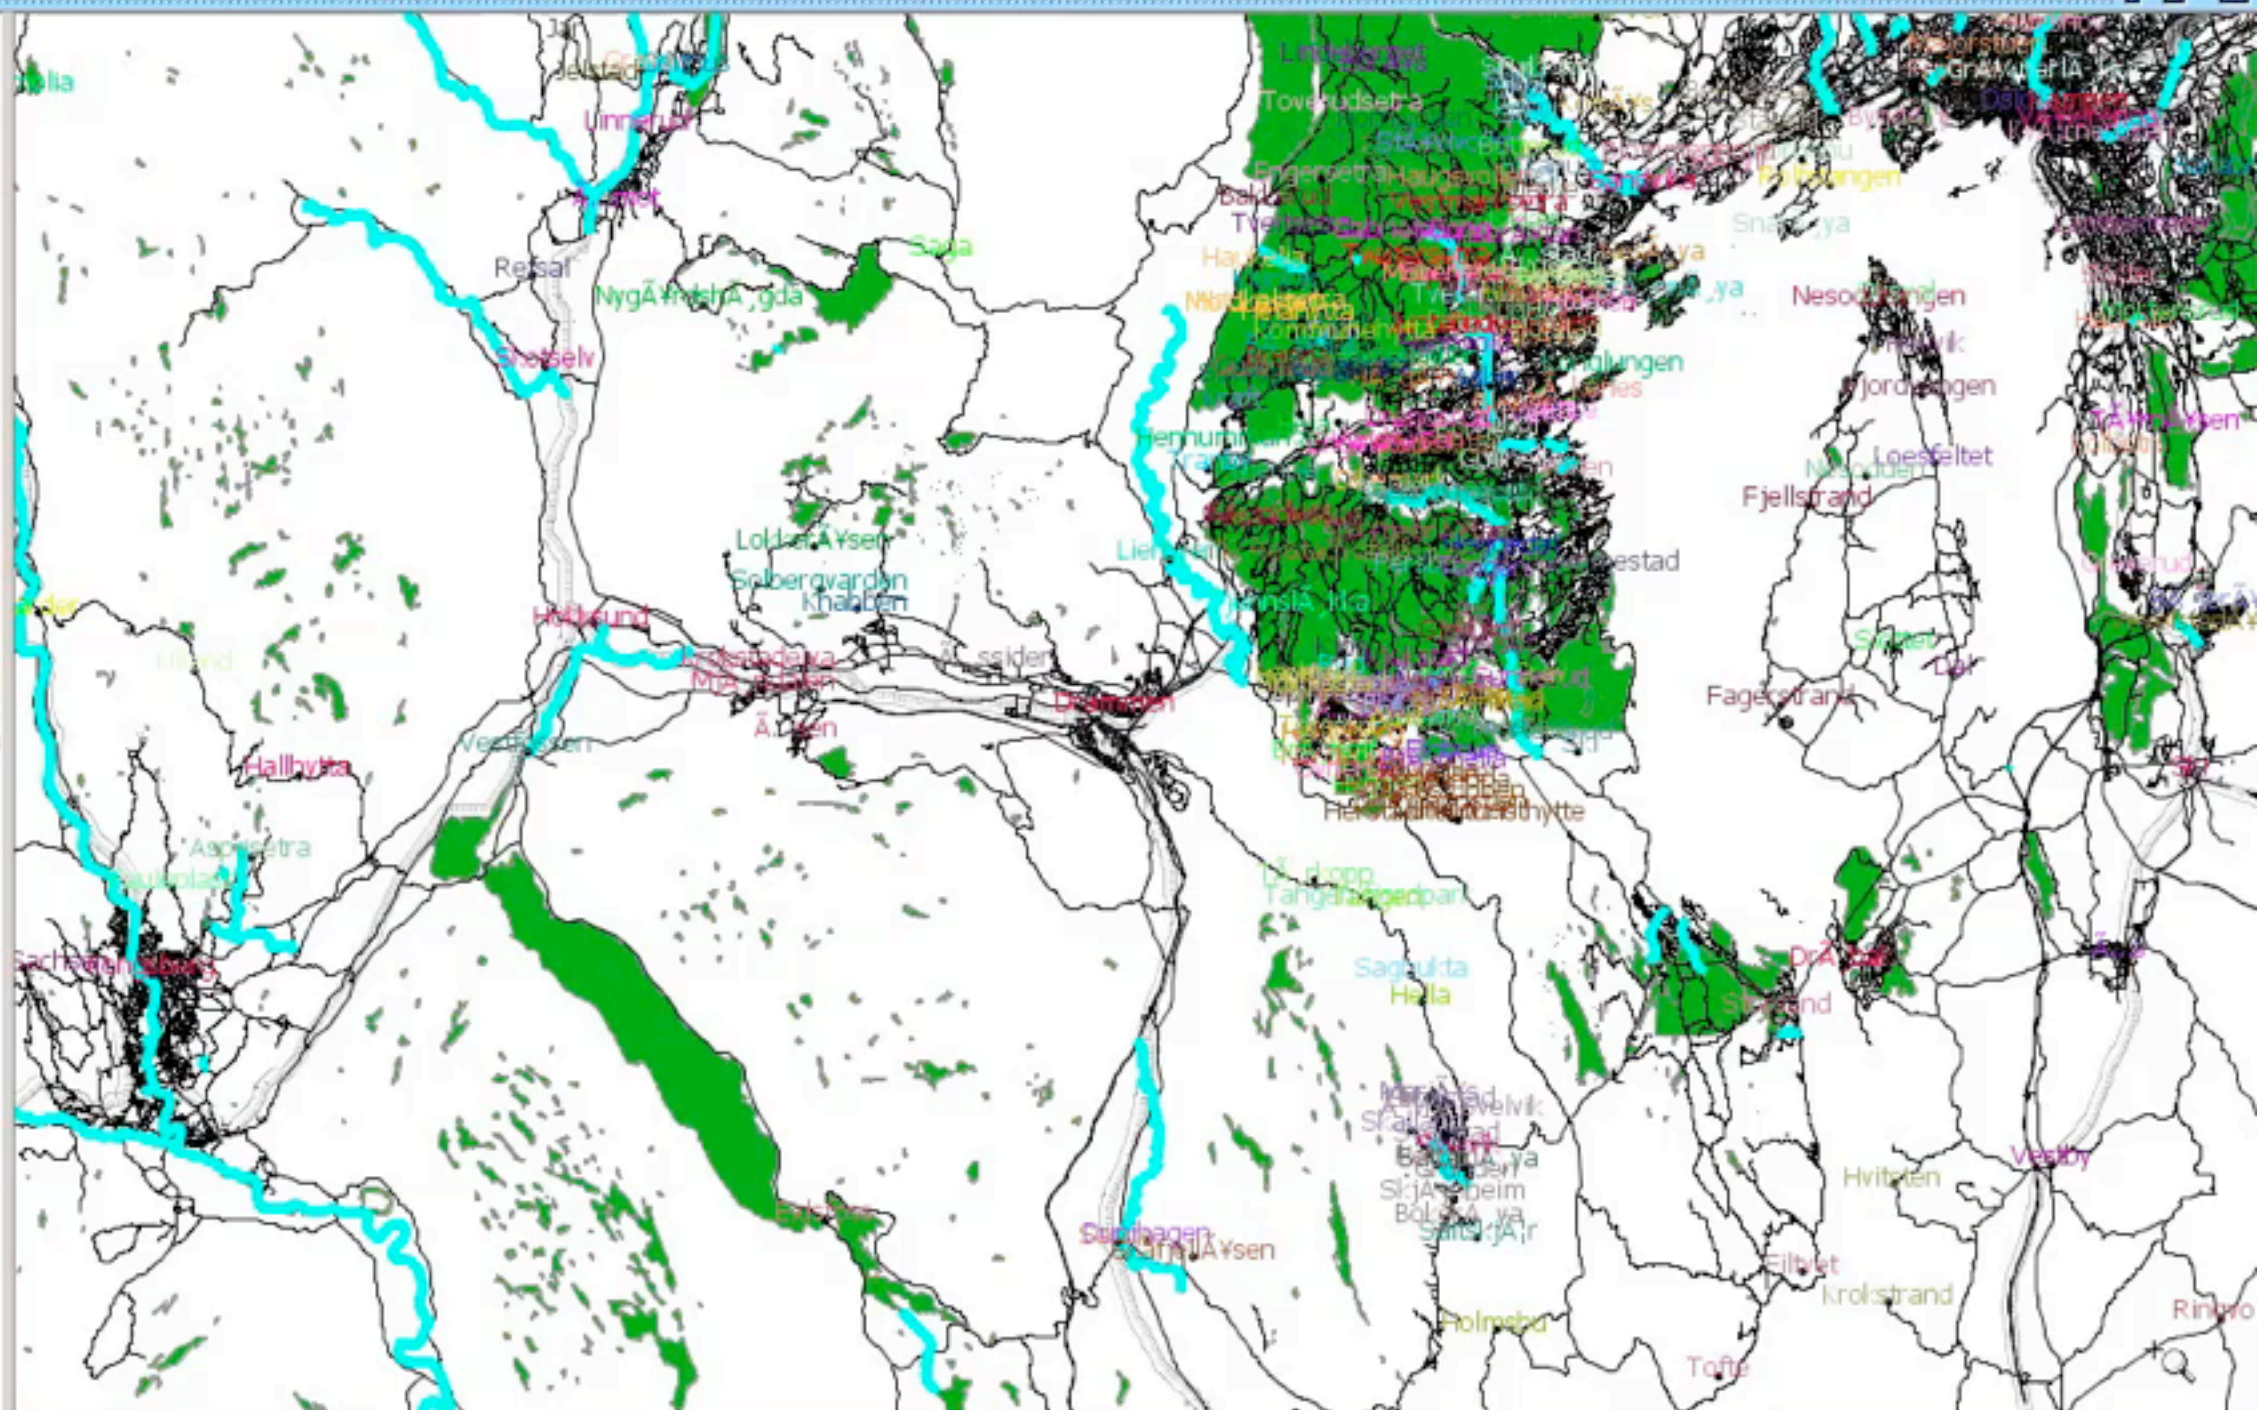

Implementation in gvSIG, Video, GRIFIN Shell, Future work.

Conclusions

- ☒ places.shp
- ☒ waterways.shp
- ☒ roads.shp
- ☒ railways.shp
- ☒ 118
- ☐ points.shp
- ☒ buildings.shp
- ☒ natural.shp

This GMO has the following Methods:

0: manage
1: viz
2: getCoarser
3: getVisual

Conclusions

R&D on flexible data representation

Mechanism for developing and exchanging of smart data models (GRIFIN).

Building energy consumption in Stromso.

Three types of clients on different platforms.

Support for visual presentation in 3d and for time.

What you gain with GMO

Uniform approach from data handling to system programming and publishing.

Two way communication.

Fast access to geographically relevant (nearest) data.

Scalability to very large heterogeneous system of systems.

Disadvantages

Depends on Virtual Machine (HotSpot)

Hard to test its main strength (on very large heterogeneous system of systems)

GRIFIN is still experimental code

Future Work

Handle multiple GMO Definitions in gvSIG.
Improve 3D to 2D geometry conversion.
Export gvSIG to predefined GMO Definition.

Define and create your own geographic models and information with no limits using GRIFIN, and connect your results quickly and easily to the results of others in an interoperable way.

The goal of GRIFIN is to make publishing of original georeferenced models a snap. GRIFIN supports creation of georeferenced content that can be viewed or analyzed. When you are done everything is organized in a single, virtual, 3d space with time and many levels of resolution. Ultimately providing a distributed digital representation of the Earth.

Download an experimental-level package for trying.

VIDEO

As this is an enthusiastic, not-for-profit effort contributions or contributors are welcome.

Performance & Scalability
GRIFIN uses HotSpot, an industry standard virtual machine (VM) technology. HotSpot is a high-performance, production quality VM with open source-code used by the highest number of programmers in the world. GRIFIN can be deployed on platforms ranging from enterprise servers to mobile devices. For improved scalability and usability Scala language is used for interaction.

Clients for the Web and mobile devices
Advanced data models based on GMOs
Peer-to-peer discovery

Thanks for your attention
